

# The bottom of the Hertzsprung-Russell with *Gaia*

José A. Caballero  
*Centro de Astrobiología*  
*(CSIC-INTA)*

# *BajaMasa* research lines

- **EXOS:** exoplanetary systems
  - EXOS-1: astrometry of known systems **AMora**
  - EXOS-2: radial velocity of new systems **MRZO**
  - EXOS-3: characterization (asteroseismology) **AMoya**
- **YBD:** young brown dwarfs
  - Bottom of the (I)MF in stellar clusters and associations **VJSB**
- **MLT:** ultracool dwarfs
  - MLT-1: late M (H-R diagram, kinematics...) **JAC**
  - MLT-2: L y T (single or as companions) **JAC**

# "BajaMasa"

- **EXOS**: exoplanetary systems

- **EXOS-1**: astrometry of known systems → new input from:

- **Radial velocity**: (SARG), CAFÉ, HARPS-N, GIANO, CARMENES, HORUS?

- **Transit**: SuperWASP+, LCOGT, SONG, XO, Master

- **EXOS-2**: radial velocity of new systems → **Kepler-like massive ground confirmation**: *everything*

- (above plus hi-res imaging; i.e., AstraLux, FastCam)

- **EXOS-3**: characterization (asteroseismology) → **Enough time sampling with *Gaia***? ("overlapping" with *PlanetVision*)

# "BajaMasa"

- **YBD**: young brown dwarfs
  - Bottom of the (I)MF in stellar clusters and associations → **What can our telescopes do for *Gaia's* YBDs vs. What can *Gaia* do for our telescopes' YBDs**

Very low-mass stars and brown dwarfs in young open clusters have in general  $V > 21$  mag (examples:  $\sigma$  Orionis, Pleiades)

And do not forget the extinction, nebulosity...

# "BajaMasa"

- **YBD**: young brown dwarfs
  - Bottom of the (I)MF in stellar clusters and associations → #Q1: What can *Gaia* do for our telescopes' YBDs?

#A1a: determine **distance** to clusters! (or to bright primary in young moving group if YBDs are in resolved binary system). Note: *distance, age and model uncertainties are the largest error contributors to mass determination (see Gaia-ESO survey)*

#A1b: direct parallax of **a few nearby YBDs** (e.g., Taurus). But **Jordi et al. (2010)+**

# "BajaMasa"

- **MLT**: ultracool dwarfs

- **MLT-1**: late M (H-R diagram, kinematics...) → See next slide...

- **MLT-2**: L y T (single or as companions) → First, forget T (and Y) (e.g.,  $\epsilon$  Ind BC:  $R = 20.8$  mag). Next, **#Q2**: how many **L dwarfs** *Gaia* will observe?

#A2: **don't know!** Again, **Jordi et al. (2010)+...**

**Please, talk to me later** (convolve real L-dwarf spectra with *Gaia* bands, normalize with 2MASS *J* band, take densities from Caballero, Burgasser & Klement 2008, and count...)

# "BajaMasa"

- **MLT**: ultracool dwarfs

- **MLT-2**: L y T (single or as companions) → #A2: **don't know?**

*Gaia will give: **parallaxes** (absolutely needed) and **proper motions** (really needed?), **wide multiplicity** (example on astro-ph today)*

*Telescopes will give: low-res spectroscopy for **SpT**-type determination (ISIS, ALFOOSC, OSIRIS, EMIR)<sup>New</sup>*

20.03.2012: 602 L dwarfs, only ~40 with parallax. **Too optimistic pre-*Gaia* estimations?...**

# *"BajaMasa"*

- **MLT**: ultracool dwarfs

- **MLT-1**: late M (H-R diagram, astrophysical parameters, exoplanets, abundances, activity, multiplicity, kinematics...) → CARMENES, CARMENES, CARMENES... (R = 82,000,  $\Delta \lambda = 0.5-1.7 \mu\text{m}$ , **1 ms<sup>-1</sup>**)

**CARMENCITA**: CARMENES Cool dwarf Information and daTa Archive ("the input catalogue")

Carmencita

**carmenes**

# "BajaMasa"

- **MLT**: ultracool dwarfs

**CARMENCITA**: all the brightest, latest M dwarfs observable from Calar Alto...

Today: 1006 stars, over 80 columns (from accurate coordinates and proper motions, through spectral types, magnitudes,  $H\alpha$  and X-rays, to  $v\sin i$  or multiplicity at all separations)

By construction, all  $V < 21$  mag

# "BajaMasa"

- **MLT**: ultracool dwarfs

*Gaia*: abundances ( $V < 12$  mag);  $T_{eff}$ ,  $\log g$ ,  $vsini$  ( $V < 13$  mag);  $V_r$  ( $V < 17$  mag); activity Ca II IR triplet ( $V < 20$  mag?); **proper motion, distance, astrometry (dynamical masses)** ( $V < 21$  mag)

CARMENCITA 2012-14 (on-going preliminary stellar characterization with CAFOS, CAFÉ, FastCam) + CARMENES 2015 + *Gaia* 2017? = **the M-dwarf Encyclopædia**

# Last remarks

- **Day+0:** *Gaia* Third Data Release (~2017)
- Day+1: A&A paper on  $d$  to  $\sigma$  Orionis
- Day+2: VLMSs and BDs in the Pleiades?
- Day+5: bright, field, L-type dwarfs
- Day+10: CARMENCITA+CARMENES+ *Gaia*

# Last remarks

**To TACs:** more time with *current* instrumentation (lo- and hi-res spectroscopy, hi-res imaging)

**To *Gaia* team:** detectability of ultracool dwarfs; a "data-retriever simulator"; data releases: what and when
